

PRODUCT DOCUMENTATION

Design System

The rules, tokens and components the application is built from — what each one is for, how it behaves, and how it appears across every screen.

One vocabulary, four screens

A design system is not a style guide. It is the **set of decisions already made**, so that building a screen is assembly rather than invention — and so two people building two screens produce one product.

What it governs

Everything inside the application: the four screens users spend time in — Games, Stats, How to Use and More — and the components they are built from. The marketing site and the brand layer — icon, splash, wordmark — are governed separately and are not changed by it.

How to use it

Building a screen: assemble from the component library; if something is missing, add it there rather than styling locally.

Changing one: check the defect register first. **Settling an argument:** the principles decide most, and the tiebreaker is whichever option better serves someone scanning fifteen items at arm's length.

THE ONE RULE THAT IS NOT NEGOTIABLE

Every change ships in **both themes**. A token defined in only one theme is a defect, not an omission — three such defects were found in the pre-existing interface, one of which made a card's background go transparent on hover in light mode.

WHERE IT LIVES

The full specification is maintained in the repository alongside the code, so it travels with the product rather than living in a design tool. This document is its summary.

Contents

02	Principles	3
	Six rules that settle most questions	
03	Colour	4
	Palette, roles and the rules of use	
04	Typography	6

06	Components	10
	The library — twelve components, rendered	
07	Patterns	15
	How components combine	
08	Across the app	16
	The system applied to each screen	
09	Accessibility	17
	WCAG 2.1 AA, per requirement	
10	Voice and governance	18
	How the product speaks, and how the system changes	

Six rules

These are ordered. When two conflict, the earlier one wins.

#	PRINCIPLE	WHAT IT DECIDES IN PRACTICE
1	The model's output is the loudest thing on screen	Predicted scores outrank team names, which outrank market data. If a change makes the prediction quieter, it is wrong.
2	Rarity earns emphasis	A high edge appears on two cards in fifteen, so it gets colour, a rail and a glow. Team names appear on all fifteen, so they get none. <i>Corollary</i> : an indicator that appears on every item and always says the same thing should not exist at all.
3	Absence is silent	Missing data shortens the layout; it never prints a placeholder. Fifteen rows of "N/A" reads as broken software.
4	Numbers are monospace, words are not	Every figure is tabular so columns align down a long list. This single rule does most of the work of making the product read as instrumentation.
5	Never imply precision the data lacks	If the app cannot measure it, the app does not display it. No confidence figures, no live detail the feed does not carry.
6	Both themes ship together	A colour defined in one theme only is a defect.

Principle 2, demonstrated

EVERY CARD EMPHASISED

EMPHASIS RESERVED

Fifteen tokens, two themes

Brand green and orange are fixed. The system adds **contrast-corrected variants**, because brand green at body sizes fails accessibility standards on the light ground. **Every token carries a value in both themes** — that is what makes the count fifteen rather than thirty.

Brand and signal — dark / light

	Brand green	#00B140 · both
	Green text	#3ADE72 / #00762C
	Brand orange	#FF7F00 · both
	Orange text	#FF9E3D / #B25600
	Accent fill	#00B140 / #00762C
	Accent fill ink	#07130B / #FFFFFF

Surfaces — dark

	Ground	#0B1016
	Panel	#151C24
	Panel 2	#1B232C
	Panel hover	#1E2833
	Line	#232E38
	Line 2	#2E3B47

Ink — dark

	Ink	#EAF0F4
	Ink 2	#8FA0AE
	Ink 3	#5E6E7C

Surfaces — light

	Ground	#F4F7F6
	Panel	#FFFFFF
	Panel 2	#F7FAF9
	Panel hover	#EEF3F1
	Line	#DFE7E3
	Line 2	#C6D2CC

Ink — light

	Ink	#0D1117
	Ink 2	#56655D
	Ink 3	#84948B

WHY THE NEUTRALS LOOK LIKE THAT

They carry a slight blue-green bias rather than being pure grey, so they sit *with* the brand mark rather than beside it. A pure mid-grey reads as unconsidered. **Stock grey ramps from the CSS framework must not be substituted** — mixing them with these tokens was the single largest source of inconsistency in the pre-existing interface.

Colour is signal, never decoration

COLOUR	PERMITTED USE	RATIONALE
Green	The model's output, and the app's own active chrome	The product's value is its prediction. Green marks it; nothing else competes.
Orange	Live game state — with one recorded exception	Rare and time-sensitive. Reserving it keeps the signal strong. The injury modal's team headings also use it, at the owner's request; that is logged as an open rule question rather than quietly allowed.
Neutrals	Everything else, in three ink weights	Hierarchy comes from weight and contrast, not hue.

THERE IS NO RED / AMBER / GREEN STATUS RAMP

Nothing in this product is an error a user can act on. A failed request is treated as absent data, or falls back to the offline state. **Introducing a semantic colour ramp would dilute green, which currently means one thing only.**

The three green intensities, in use

HIGH EDGE

1:10

DET Detroit

4.5

MEDIUM EDGE

1:35

NY New York

4.6

LOW EDGE

2:10

CIN Cincinnati

4.3

High. Fill, border, glow and a card rail.

Medium. Tint and a soft border. No rail.

Low. Outline only, muted text.

Contrast

PAIRING	DARK	LIGHT	USE
Ink	14.93 : 1	18.92 : 1	Body and scores
Ink 2	6.38 : 1	6.15 : 1	Secondary text, market data
Ink 3	3.27 : 1	3.19 : 1	Micro-labels only, 700 weight uppercase
Green text	9.70 : 1	5.79 : 1	Green text, icons and focus rings
Orange text	8.35 : 1	4.97 : 1	Live state
Brand green as text	6.02 : 1	2.85 : 1	Fails on light. Fills only, never type

Measured against `panel` in each theme, not estimated, and re-measured whenever a token changes. Two findings worth stating: **brand green passes on the dark panel and fails on the light one**, so the single rule "never type" is safer than a per-theme exception — and the green text token is therefore a legibility choice at small sizes on dark, and an accessibility necessity on light. Light orange text is `#B25600` rather than anything lighter because it must also clear 4.5:1 against the ground, where it measures 4.61:1.

Two faces, two jobs

The separation is functional, not stylistic. **Anything that is a number, or labels a number, is monospaced.** Everything else is proportional.

DISPLAY & INTERFACE

Cleveland Guardians

Detroit Tigers · Buffalo Bills · Boston Celtics

Archivo — a grotesque, slightly condensed, strong at heavy weights. Team and player names, interface labels, headings, body copy. Fallback: Inter Tight, then the system UI stack. **Specified but not yet served** — see the note below.

DATA

118.9 · 4.5 · 27.6

+114 / -119 -1.5 0/U 8.5 1:10 PM

HIGH EDGE · LIVE · FINAL · AWAY · HOME

JetBrains Mono — scores, odds, times, percentages and every uppercase micro-label. Tabular figures by default. Fallback: IBM Plex Mono, then the system monospace stack, which is available everywhere at no download cost.

THE SANS FACE IS SPECIFIED, NOT YET SHIPPED

No font file is served today, so the interface resolves to the system UI sans and the monospace stack resolves to Consolas.

The monospace rule above is unaffected and does ship, because it holds on the fallback stack — which is the half of this page that does the work. Adopting Archivo means self-hosting the files; it is recorded as an open decision, not an oversight. A previous build fetched a third face from a font CDN that no rule referenced; that request was removed rather than replaced.

A SERIF IS CONFIGURED AND DELIBERATELY UNUSED

PT Serif remains in the framework configuration for the marketing pages. It has no job in a scoreboard, and does not appear anywhere in the application interior.

Why it matters

Cleveland	3.7
Detroit	11.5
Houston	118.9

Proportional. Digit widths differ, so the decimal drifts and the eye re-finds the column on every row.

Cleveland	3.7
Detroit	11.5
Houston	118.9

Tabular. Fixed digit widths in a fixed column. The right edge never moves.

The scale

Fourteen defined roles. Anything not on this list does not exist — if a new size seems necessary, one of these is probably the right answer.

ROLE	SIZE	WEIGHT	TRACKING	FACE
Screen heading	20px	700	−0.02em	Archivo
Section heading	15px	650	−0.015em	Archivo
Team / player name	15px	600	−0.012em	Archivo
Body copy	14px	400	0	Archivo
Predicted / final score	21px	700	−0.03em	Mono
Table cell — numeric	13px	500	0	Mono
Table cell — text	13px	400	0	Archivo
Market strip	11.5px	400	+0.01em	Mono
Chip label	12px	600	0	Archivo
Edge chip	10px	700	+0.12em uc	Mono
Time	11px	400	+0.07em uc	Mono
State label	10px	700	+0.16em uc	Mono
Abbreviation chip	10.5px	700	+0.04em	Mono
Column / micro-label	9.5px	700	+0.10em uc	Mono

MEASURE

Body prose sits at 14px with a maximum measure of about **65 characters**. Headings take balanced wrapping so a two-line heading does not leave one word alone.

THE HEAVIEST NUMBER WINS

The predicted score at 21px is **the largest figure on any card** — a direct expression of principle 1. In the previous interface it was 13px, smaller than the team names beside it.

A 4-point scale

Eleven permitted steps. Values off this scale are how layouts drift out of rhythm.

SPACING STEPS

Applied

Screen padding — mobile	12
Screen padding — desktop	24
Gap between cards	10
Card padding	11 · 13 · 10
Gap between chips	7
Label to value	2
Section within a card	10 + hairline
Section on a screen	24

Radius

Card, modal, table wrapper	14px
Chip, button, input	8px
Pill, segmented control	999px
Abbreviation chip, edge chip	5px

DENSITY IS DELIBERATE

The Games list is tight because its job is scanning. Prose screens breathe more. **On a list, tighten; on a document, loosen.**

Depth by surface, not shadow

On a near-black ground a drop shadow is nearly invisible. A one-pixel top highlight reads better — the card looks machined rather than floated.

Panel fill, hairline border, and a highlight fading out at both ends.

SURFACE	TREATMENT
Card	Panel fill, 1px line, top highlight on dark
Card — high edge	Tinted border, 3px rail, corner wash
Modal, popover	Real drop shadow — these float and should say so
Sticky bars	Ground fill, 8px backdrop blur, 1px edge. No shadow

In light mode cards additionally take a soft `0 1px 2px rgba(0,0,0,.05)`, where a shadow does read.

Motion confirms a change; it never announces one

INTERACTION	DURATION	EASING
Hover — surface and colour	160ms	ease
Chevron rotation on expand	200ms	ease
Card expand / collapse	200ms	ease-out
Tab and toggle transition	160ms	ease
Skeleton shimmer	1400ms	ease-in-out, loop
Live pulse	1700ms	ease-in-out, loop

REDUCED MOTION

Every animation respects the operating-system preference. The live pulse and skeleton shimmer both stop; **the live dot stays visible at full opacity**, because it carries meaning that must not depend on movement.

NO ENTRANCE ANIMATIONS

List items never stagger in. It is a novelty the second time and an obstacle the twentieth.

The card

The primary container, and the component the whole system was designed around. **A matchup, not a list of facts.**

Expanded state shown. Sections divide by hairline, never by nested boxes — the card stays one object.

REGION	RULES
Status rail	Edge chip left, time or state right. Always present; the left slot is empty when there is no edge.
Team rows	Away first, then home. Order never changes. Abbreviation, name, value.
Value column	Fixed 74px minimum, right-aligned, tabular. The edge never moves between sports.
Pick marker	Higher predicted score. Full contrast plus a triangle; the other row recedes. On a tie, neither is marked.
Market strip	Present values only. Hidden entirely on finished games.
Expanded	Lean bar, pitchers where applicable, action chips.

Variants

Default	Panel, hairline, highlight
High edge	Green rail, tinted border, wash
Live	Orange rail, pulsing dot
Finished	68% opacity, score held at contrast

BEHAVIOUR

On mobile the whole card toggles its expanded state, except for elements explicitly marked as actions. On desktop, where there is room, cards are expanded by default.

Chips and controls

Chips — one component, three uses

Action. 32px min height, bordered, opens a modal. Icon optional.

Edge. Tier drives colour, weight and glow. Not interactive.

State. No border, monospaced, tracked. Not interactive.

RULE

A non-interactive chip must not use hover or pressed styling. **If it looks like a button, it must behave like one.** The dome weather chip is stated, not tappable, and is styled accordingly.

Segmented control

One component, four applications — the sport switcher, the Stats sub-tabs, the season selector and the theme control on More. The pre-existing interface had three separate implementations of this control, styled three different ways; there is now exactly one.

Buttons and inputs — specified, not yet built

Primary	Green fill, 38px min height. One per view at most.
Secondary	Outline, secondary ink.
Ghost	No border; background tint on hover.
Input	Panel fill, control border. Focus swaps the border to green text and adds a ring.

Every interactive element carries a visible focus state and a 44px minimum touch target, reached with padding where the visible element is smaller. **This is the one component in the library not yet built as shared code** — buttons are still styled at each call site, which is the condition that produced three segmented controls and three chip styles before them.

Data table

One configured component renders all five of the Stats screen's datasets. **Numeric columns are monospaced, right-aligned and tabular** — the same rule as the card, applied at scale.

TEAM	W	L	WIN % ▼	PPG	OPP	DIFF
Boston Celtics	64	18	.780	120.6	109.2	+11.4
Denver Nuggets	57	25	.695	114.9	109.6	+5.3
Oklahoma City Thunder	57	25	.695	120.1	112.7	+7.4
Minnesota Timberwolves	56	26	.683	113.0	106.5	+6.5
Los Angeles Clippers	51	31	.622	115.6	112.4	+3.2

Sample data, for layout illustration only. The sorted column's header takes the accent colour and a direction caret; every other header stays muted.

PLAYER	TEAM	PTS ▼	REB	AST	3P%	MIN
Luka Dončić	Dallas	33.9	9.2	9.8	.382	37.5
Giannis Antetokounmpo	Milwaukee	30.4	11.5	6.5	.274	35.2
Shai Gilgeous-Alexander	Oklahoma City	30.1	5.5	6.2	.353	34.0
Jalen Brunson	New York	28.7	3.6	6.7	.401	35.4

The same component in light mode. Decimal points align down every column regardless of digit count.

ELEMENT	RULE
Wrapper	14px radius, hairline border, horizontal scroll inside itself
Header	Panel-2 fill, sticky, monospaced uppercase micro-label
Row	Hairline separator, no zebra striping, tint on hover
Numeric cell	Monospaced, tabular, right-aligned
Text cell	Proportional, left-aligned

THE TABLE SCROLLS, THE PAGE DOES NOT

Wide tables scroll horizontally inside their own container. The page body must never scroll sideways. Where scrolling is likely, **the first column pins** so the player or team name stays visible.

Navigation

Three persistent surfaces: a header, a filters bar beneath it, and a bottom tab bar. All three use the **ground colour with a backdrop blur** — never a shadow, and never a different black.

DARK

LIGHT

A DEFECT THIS REPLACES

The pre-existing header used pure black beneath an app ground of `#0d1117`, producing a **visible seam** across the top of every screen. Using the ground token removes it.

Icons

A single open-source icon set, 1.8px stroke, sized 13px in chips, 16px in controls and 20px in the bottom bar. Icons support a label; they rarely replace one. The exceptions are the chevron and the bottom bar, where the label sits directly beneath.

NO EMOJI IN THE INTERFACE

Emoji render differently on every platform, ignore the theme, and cannot inherit colour. The pre-existing interface used them for the indoor-venue and no-prediction markers; both become proper glyphs that follow the current text colour.

Loading, empty, and modal

The states most often left to chance. **Skeletons mirror the anatomy of what is loading**, so nothing reflows when data arrives.

SKELETON

Rail, two rows, footer — the real card's shape.

EMPTY

States a fact, then offers the next step.

MODAL

Floats, so it takes a real shadow. Focus trapped; Escape closes.

STATE	RULE
Loading	Anatomy-matched skeleton. Never a spinner, never the word "Loading"
Empty	Icon, title, one factual line, and a next step where one genuinely exists
Offline	Explains what still works, not only what does not
Error	Treated as absent data, or falls back to offline

WHY NO ERROR STATE

The application has **no user-actionable errors**. A failed request means a value is missing, and principle 3 already says what to do about that: shorten the layout and say nothing. An error dialogue would ask the user to solve a problem they cannot solve.

How components combine

Scanning a long list

The recipe that makes fifteen cards readable at a glance. It generalises to any list in the product.

1	A fixed anchor column	An abbreviation chip starts each row, so the eye locks on without parsing a long name.
2	A fixed value column	Right-aligned and tabular, so values align down the list regardless of digit count.
3	Contrast marks importance	The item of interest keeps full contrast; the rest recede. No extra chrome.
4	Rare signals get one loud treatment	Colour, border and rail together — not several quiet hints.

Absence and fallback

SITUATION	RESPONSE
A value in a group is missing	Omit it; the group closes up
Every value in a group is missing	One muted line, or omit the group
An optional section is empty	Omit the section
A paired value has only one half	Omit both — half a moneyline is meaningless
Data is genuinely pending	Say so once, plainly

Never "N/A". Never an em-dash placeholder. Never an empty row where a value would be.

State encoded in form

Live	Orange, pulsing dot, rail
Finished	68% opacity, score held
Model's pick	Full contrast + triangle
High edge	Rail, border, wash, glow

Each survives a squint, and none depends on colour alone.

Progressive disclosure

Collapsed carries what you need to decide whether to look closer; expanded carries the rest. The chevron indicates state and rotates on open. On desktop, where there is room, cards open by default.

PER-SPORT VARIATION IS ADDITIVE

The card is one component across baseball, American football and basketball. The differences are three: probable pitchers appear for baseball only, the weather chip is dome-aware for football and absent for basketball, and **the value column is sized for the widest case across all three** so its edge never moves.

The system applied

Every screen a user can reach is built and live on this system, and **none of them needed a new visual language**.

SCREEN	STATE	COMPONENTS USED	NOTES
Games	Built & live	Card, chips, edge chip, segmented control, header, bottom bar, skeleton, empty	All states, all three sports, all fallbacks
Stats	Built & live	Data table, segmented control, input, skeleton, empty	Five datasets, one configured table. The sorted column is the subject
How to Use	Built & live	Prose layout, numbered timeline, card components	The one prose screen. Its specimen is built from the card's own parts
More	Built & live	List row, segmented control, offline notice	Fourteen rows in four groups, on the library's last component
Game detail	Direction only	Card, chips, modal	Never built. It expands from a card, which already does most of its job

The **guided tour** is built and live too. It is not a screen but spans three of them — nine steps, filtered per sport.

GAMES, ASSEMBLED

Header, segmented control, day bar, three card variants and the bottom bar — every element drawn from the library on the preceding pages.

WCAG 2.1 AA

Treated as a build requirement rather than an audit item. Several of these rules **shaped the palette and the state encoding directly**.

REQUIREMENT	RULE
Text contrast	4.5:1 for body; 3:1 for 18px+ or 14px bold. <i>This is why the green text token exists.</i>
Non-text contrast	3:1 for control borders, focus rings and the edge chip's border
Touch targets	44 × 44px minimum, reached with padding where the visible element is smaller
Focus	Every interactive element has a visible focus state: a 2px green ring at 2px offset. Suppressing the outline without a replacement is a defect
Motion	All animation respects the reduced-motion preference; meaning never depends on movement
Colour independence	No meaning is carried by colour alone — the edge tier also varies by border, glow and label; the pick also has a triangle; live also has a word
Semantics	Cards are articles; expandable regions carry expanded state; toggles carry pressed state; sortable headers carry sort state
Screen reader	Predicted scores carry a label giving both numbers and their meaning, since splitting them across two rows loses that context visually

COLOUR INDEPENDENCE, WORKED THROUGH

A user who cannot distinguish the green tiers still reads "High edge" in the chip, sees the heavier border, and sees the rail on the card's edge. A user who cannot see the orange live dot still reads the word LIVE. **Every signal in the system has at least two encodings.**

FOUND IN THE PRE-EXISTING INTERFACE, AND CLOSED

Three failures were recorded during the audit: a focus outline suppressed with no replacement, leaving the sport selector with no keyboard indication; a reduced-motion preference honoured by exactly one rule; and white heading text on a near-white panel, which is invisible rather than merely low-contrast. **All three are fixed**, along with every other accessibility defect the audit found — including two contrast failures on interactive labels that were worse than anything the original brief had listed, and a sortable table header that announced itself to a screen reader as a control the keyboard could not operate.

How the product speaks

Plain, factual, unhedged. **The app reports; it does not persuade or apologise.**

WRITE THIS	NOT THIS
Odds not yet posted	Odds unavailable at this time
No NBA games on August 4	Sorry, nothing to show!
Roof closed	Weather N/A
Started 7:05 PM	Game in progress since 7:05 PM
High edge · DET	Strong value pick!

Rules

- **Never imply certainty the model lacks.** No "lock", "guaranteed", "sure thing".
- State facts, not feelings.
- Sentence case for headings and buttons; uppercase only for monospaced micro-labels.
- Team names in full in prose; abbreviations only in chips.
- No exclamation marks. No emoji.

WHY THIS MATTERS HERE SPECIFICALLY

The product sits next to betting markets. Language that oversells a prediction is both a credibility risk and a regulatory one. **Understatement is the safer and the more convincing register.**

Governance

SITUATION	WHAT TO DO
Need a colour that is not in the palette	The palette is missing something. Add it to the system first, in both themes, with a contrast check — never inline in a component.
Need a component that does not exist	Add it to the library rather than styling it locally. One is owed already: buttons and inputs, still styled per call site.
Need a size off the type scale	One of the fourteen roles is probably right. If none is, add a role rather than a one-off value.
A change looks right in one theme	It is not finished. Both themes ship together.

THE SYSTEM'S OWN RECORD

This document summarises a specification maintained in the repository alongside the code, so it travels with the product rather than living in a design tool. That specification also records **what the application actually knows** — including two facts the code implies but does not deliver, which had already misled a reader once.

ScoreGenius — Design System, version 1.12. Prepared 17 August 2026. **This document describes running code**, with three exceptions stated where they occur: the sans typeface, the button and input components, and game detail. Every interface image in this document is rendered from the system's own token values. Statistical figures in table specimens are sample data for layout illustration only.
