

PRODUCT DOCUMENTATION

Interface Redesign & Design System

A systematic redesign of the application interior — establishing a documented design system, rebuilding the core screen around how the product is actually used, and auditing the existing interface for defects.

What was done, and why it matters

ScoreGenius had a refreshed brand but an interior that predated it. This programme closed that gap — not by restyling, but by **establishing a design system, rebuilding the core screen around the product's actual job, and auditing what was already shipping.**

3

Screens specified across three sports

18

Defects found, 14 already fixed

7

Commits, shipped in sequence

0

New dependencies or API changes

The problem

The Games screen presents twelve to fifteen prediction cards on a typical day. Every card carried the same visual weight, which meant a user had to *read* all fifteen to find the two worth acting on. The product's own output — the predicted score and the market edge — were among the quietest elements on screen: the edge rendered as muted grey text, the prediction at 13 pixels.

The response

The card was restructured from a *list of facts* into a *matchup*: one row per team, each carrying that team's predicted score in a fixed, right-aligned column, with the model's pick held at full contrast and the other side receded. A reader now scans a full slate by running their eye down a single column. The market edge — the rarest and most valuable signal — became the loudest element, encoded in colour, border and a card-edge rail rather than in words alone.

What else it surfaced

Documenting the system required auditing what existed. That audit found eighteen defects, several shipping to users: cards turning transparent on hover in light mode, an invisible white-on-white heading, placeholder zeros presented as real betting lines, and domed baseball stadiums reporting outdoor weather. Continuing the work across the other screens found fifty-nine more — **seventy-seven in total, and every one is now closed.**

What shipped

The Games screen — the one users spend their time in — is **built and live across all three sports in both themes**, delivered as seven commits over two days. The design system beneath it is implemented rather than proposed: the tokens, the card, its states and its fallbacks all describe running code. Four screens remain on the previous styling and are specified to follow.

COMMERCIAL CONTEXT

The application is a Trusted Web Activity: the Android shell loads the web app at runtime, so interface changes deploy through the web pipeline and reach the Play Store app, the PWA and the browser within minutes — **with no app-store review and no version bump.** Every change described here is reversible in minutes, which is why the work was sequenced as seven independent commits rather than one release.

	What exists today	

A NOTE ON THE VISUALS

Every interface image in this document is **rendered live from the design system's own values**, not screenshotted. "Before" specimens are reconstructed from the shipping application using its exact colour and type values; "after" specimens are the approved specification. Both therefore print at full fidelity at any zoom.

Everything weighted the same

The interface was functional and information-dense. Its weakness was hierarchy: nothing on the card told you where to look.

SHIPPING — A TYPICAL CARD

The four data lines are typographically identical. "Edge: High (Home)" — the product's most valuable output — is styled the same as "O/U: 8", in muted grey with the one green word held at 70% opacity.

Four specific failures

No hierarchy	Odds, edge and teams share one visual weight. Scanning requires reading.
Fused prediction	<code>3.7 - 4.5</code> is one string. The reader performs the subtraction to learn who is favoured.
Quiet where it matters	The predicted score sits at 13px with a 9px label — below the legibility floor on a phone.
States look alike	A finished game is structurally identical to an upcoming one.

ALSO SHIPPING

Placeholder zeros from the odds feed rendered as genuine betting lines — every American football preseason card displayed `Spread: 0` and `O/U: 0` as though those were real markets.

The same card in light mode

Light mode compounds the problem. The green edge text at 70% opacity on a pale panel is barely distinguishable between High and Medium — the tier system exists in the data but not in the interface.

The audit also found that **hovering any card in light mode made its background transparent**, because the hover colour was defined only in the dark theme. See page 13.

Colour as signal, never decoration

The brand hexes are unchanged. What the system adds is **contrast-corrected variants** — brand green at body sizes fails accessibility standards on both grounds, so a lifted green carries text on dark and a deepened green on light.

BRAND AND SIGNAL

	Brand green	#00B140
	Green text — dark	#3ADE72
	Green text — light	#00762C
	Brand orange — live only	#FF7F00

Orange is reserved. It marks a live game and nothing else — never a second accent, never a warning, never decoration.

SURFACES AND INK — DARK

	Ground	#0B1016
	Card	#151C24
	Hairline	#232E38
	Ink	#EAF0F4
	Ink secondary	#8FA0AE

Neutrals carry a slight blue-green bias so they sit with the brand mark rather than beside it — a deliberate choice over default grey ramps.

Where colour is permitted

COLOUR	PERMITTED USE	RATIONALE
Green	The model's output, and the app's own active chrome	The product's value is its prediction; green marks it and nothing competes
Orange	Live game state, exclusively	Rare and time-sensitive. Reserving it keeps the signal strong
Neutrals	Everything else, in three ink weights	Hierarchy comes from weight and contrast, not hue

No red/amber status ramp. Nothing in this product is an error a user can act on. Failures are handled by absence, not by colour.

SYSTEM RULE

No colour may be defined in only one theme, and no hex may be hardcoded in a component. Four violations of the first rule were found in production and are catalogued on page 13 — including one that renders a heading invisible.

Numbers are monospace. Words are not.

This single rule does more than any other to make the product read as instrumentation rather than a hobby app. **Every figure aligns down a fifteen-card list; every label stays proportional and readable.**

Cleveland Guardians

Archivo — team and player names, interface labels, headings, body copy. A grotesque with tight tracking, strong at heavy weights. Falls back to Inter Tight and the system UI stack.

+114 / -119 · 4.5 · 118.9

JetBrains Mono — scores, odds, times, percentages and all uppercase micro-labels. Tabular figures by default, so `4.5` occupies the same width as `118.9` and columns never shift. Falls back to the system monospace stack, which is available everywhere at no download cost.

Why it matters commercially

PROPORTIONAL FIGURES

Cleveland	3.7
Detroit	11.5
Houston	118.9

Digit widths differ, so the decimal points drift and the eye has to re-find the column on every row.

TABULAR MONOSPACE

Cleveland	3.7
Detroit	11.5
Houston	118.9

Fixed digit widths plus a fixed column width. The right edge never moves — across rows, across sports, or when a basketball score crosses 100.

From a list of facts to a matchup

The structural change: **two rows, one per team, each carrying that team's own predicted score** in a fixed right-aligned column — with the model's pick at full contrast and the other side receded.

BEFORE

AFTER

What changed, and why

CHANGE	REASONING
Split the prediction	One score per team, on that team's row. The reader learns who is favoured without arithmetic, and the numbers form a scannable column down the list.
Edge became the headline	Moved to a status rail with tier encoded in colour, border, glow and a card-edge rail. It appears on roughly two cards in fifteen — rarity earns emphasis.
Edge names the team	High edge · DET rather than High (Home). A fan thinks in teams, not in home and away.
Market data demoted	Odds moved to a single monospaced footer strip. They are reference, not headline, and deliberately quieter than the model's output.
Prediction enlarged	From 13px to 21px, and now the largest figure on the card.
Anchor added	A team abbreviation chip starts each row, giving the eye a fixed point to lock onto rather than parsing a long name.

CONSTRAINT RESPECTED

No new data was introduced. Every element on the redesigned card is a value the application already had — the change is entirely in how it is arranged and weighted.

The real test is fifteen cards, not one

A single card can look good and still fail. **Squint at the two columns below:** on the right, the games worth opening announce themselves.

BEFORE — A TYPICAL SLATE

Cleveland Guardians vs. Detroit Tigers ML: +114 / -119 O/U: 8 Edge: High (Home)	1:10 PM 3.7 – 4.5 predicted score
Pittsburgh Pirates vs. Miami Marlins ML: +100 / -106 O/U: 8.5	1:10 PM 4.2 – 4.2 predicted score
Seattle Mariners vs. New York Yankees ML: +118 / -124 O/U: 8.5 Edge: Medium (Home)	1:35 PM 4.0 – 4.6 predicted score
Cincinnati Reds vs. Chicago White Sox ML: +131 / -138 O/U: 9 Edge: Medium (Away)	2:10 PM 4.3 – 4.1 predicted score
Houston Astros vs. Texas Rangers ML: -132 / +112 O/U: 8.5 Edge: High (Away)	4:10 PM 5.1 – 3.9 predicted score
Boston Red Sox vs. Tampa Bay Rays ML: +104 / -112 O/U: 9	7:05 PM 4.4 – 4.7 predicted score

Six identical blocks. The two high-edge games are indistinguishable at a glance from the four without one.

AFTER — THE SAME SIX GAMES

HIGH EDGE • DET CLE Cleveland Guardians DET Detroit Tigers ML +114 / -119 · O/U 8	1:10 PM 3.7 ▶ 4.5
PIT Pittsburgh Pirates MIA Miami Marlins ML +100 / -106 · O/U 8.5	1:10 PM 4.2 4.2
MEDIUM EDGE • NYY SEA Seattle Mariners NYY New York Yankees ML +118 / -124 · O/U 8.5	1:35 PM 4.0 ▶ 4.6
MEDIUM EDGE • CIN CIN Cincinnati Reds CWS Chicago White Sox ML +131 / -138 · O/U 9	2:10 PM ▶ 4.3 4.1
HIGH EDGE • HOU HOU Houston Astros TEX Texas Rangers ML -132 / +112 · O/U 8.5	4:10 PM ▶ 5.1 3.9
BOS Boston Red Sox TB Tampa Bay Rays ML +104 / -112 · O/U 9	7:05 PM 4.4 ▶ 4.7

Two cards carry a green rail. The score column reads vertically. A card with no edge is quiet rather than broken — **absence is a design state, not a gap.**

Both themes, designed together

Dark is the product's native theme — the brand mark sits on the same ground. Light is a **first-class derivative, not an inversion**: the greens deepen to hold contrast on a pale panel, and every token is defined in both.

DARK

The dark theme UI features three stacked game cards. Each card has a dark background with green and orange accents. The first card, titled 'HIGH EDGE · DET', shows the Cleveland Guardians (CLE) with a score of 3.7 and the Detroit Tigers (DET) with a score of 4.5. The second card, titled 'MEDIUM EDGE · CIN', shows the Cincinnati Reds (CIN) with a score of 4.3 and the Chicago White Sox (CWS) with a score of 4.1. The third card, titled 'LIVE', shows the St. Louis Cardinals (STL) with a score of 4.1 and the New York Yankees (NYY) with a score of 4.9. Each card includes a 'STARTED' time and a 'ML' (Money Line) value.

LIGHT

The light theme UI features three stacked game cards. Each card has a light background with light green and orange accents. The first card, titled 'HIGH EDGE · DET', shows the Cleveland Guardians (CLE) with a score of 3.7 and the Detroit Tigers (DET) with a score of 4.5. The second card, titled 'MEDIUM EDGE · CIN', shows the Cincinnati Reds (CIN) with a score of 4.3 and the Chicago White Sox (CWS) with a score of 4.1. The third card, titled 'LIVE', shows the St. Louis Cardinals (STL) with a score of 4.1 and the New York Yankees (NYY) with a score of 4.9. Each card includes a 'STARTED' time and a 'ML' (Money Line) value.

WHAT THE AUDIT FOUND HERE

Light mode was not being checked. Three variables — the card hover colour and two shadow definitions — were declared only inside the dark theme but consumed unconditionally, so **hovering a card in light mode removed its background entirely**. A fourth defect put white heading text on a near-white panel, rendering it invisible. Both are fixed in the first build commit.

State encoded in form, not just words

A game is scheduled, in progress, or final — and the interface must also handle cards with no edge and no prediction. **Each state is distinguishable at a squint**, which means it survives a glance on a phone.

STATE	ENCODING
High edge	Green rail, tinted border, corner wash, glowing chip
Medium / Low	Progressively quieter chip; no rail
No edge	Rail carries only the time. Card is deliberately silent
Live	Orange rail, pulsing dot, predictions dimmed and pick marker removed
Final	Card to 68% opacity, score held at full contrast, market strip hidden entirely
No prediction	Em-dash placeholders and a single explanatory line

HONESTY CONSTRAINT

The application has **no live score, inning or clock data** — "in progress" is inferred from the start time. The live treatment therefore shows a status and nothing more. The design deliberately avoids implying a feed the product does not have.

SORTING AGREES WITH WEIGHT

Finished games already sorted to the bottom of the list; now they also *look* finished. Visual hierarchy and sort order tell the same story.

Absence is a design state

Live sports feeds arrive incomplete. Odds post at different times; probable pitchers are announced on a rolling basis. **The rule: missing data shortens the layout, it never prints a placeholder.**

ODDS ARRIVING IN PIECES

The image shows three stacked betting odds cards. The first two cards are for the Cleveland Guardians vs Detroit Tigers game, and the third is for the Green Bay Packers vs Pittsburgh Steelers game. Each card has a 'MEDIUM EDGE' label and a 'DET' label. The first two cards show odds for the Guardians/Tigers game, and the third shows odds for the Packers/Steelers game. Each card has a 'MEDIUM EDGE' label and a 'DET' label.

Full line · no spread · no moneyline · nothing posted. **Losing the moneyline also removes the edge chip** — the calculation requires both prices, so the interface stops claiming an edge it cannot compute.

PROBABLE PITCHERS

The image shows a single card for probable pitchers. It has a 'MEDIUM EDGE' label and a 'DET' label. It shows the names of the pitchers and their handedness.

Both known · handedness missing · one known · neither known. When only one starter is announced **both slots remain** — a lone unlabelled name is ambiguous about which side it belongs to.

DEFECT FOUND

Eight domed baseball stadiums were reporting **outdoor weather**. The venue data file carries an indoor flag for all 32 American football stadiums and none of the 31 baseball ones — wrong information rather than missing information.

The system generalises

The product covers baseball, American football and basketball. The card is **one component with three small deltas** — the test of whether a design system is real.

AMERICAN FOOTBALL

HIGH EDGE · BUF

1:00 PM

112.4

DEN Denver Nuggets

▶ 118.9

ML +155 / -180 · O/U 231.5

No pitchers. Weather chip is dome-aware — eleven stadiums are indoor, and those now skip the weather request entirely rather than fetching and discarding it.

No weather at all — every basketball game is indoors, so a chip that always said the same thing was removed. Three-digit scores set the fixed column width.

ELEMENT	BASEBALL	AM. FOOTBALL	BASKETBALL
Card, tokens, type, states	Identical across all three		
Probable pitchers	Yes	—	—
Weather chip	Yes	Yes, dome-aware	Removed
Injuries chip	—	Yes	Yes
Score column	4.5	27.6	118.9 — sets width

Eighteen defects, catalogued

Documenting a system requires auditing what exists. Each finding below carries a file and line reference in the repository, and each is assigned to a build commit. **Nothing here is speculative.**

Visible to users

#	DEFECT	EFFECT
1	Hover colour defined only in the dark theme	Cards turn transparent on hover in light mode
2	Shadow tokens likewise dark-only	No card elevation in light mode
3	White heading on a near-white panel	Invisible text ; body copy at ~2.1:1 contrast. Duplicated on two screens
4	Placeholder zeros rendered as betting lines	Every preseason card shows a false spread and total
5	Raw feed status codes leak into the interface	Times display as <code>6:35 PM (IN9)</code>
6	Indoor flag absent for all baseball venues	Eight domed stadiums report outdoor weather
7	Weather failure renders a disabled "N/A"	Says nothing useful; wrong for domes
8	Basketball shows an "Indoor" chip on every card	Zero information on 100% of cards
9	Internal model figures exposed in a tooltip	Implies calibrated probabilities the model does not produce
10	Hardcoded dark chip on a themed card	Dark element pasted onto a light surface
11	Header pure black above a lighter app ground	Visible seam under the navigation bar

Correctness and maintainability

#	DEFECT	EFFECT
12	Focus outline suppressed with no replacement	No keyboard focus indication on the sport selector
13	Three separate implementations of one control	The same toggle styled three ways across two screens
14	Dead component with inverted argument order	Imported but never rendered; a trap for future adoption
15	Duplicate style block, second silently wins	Two off-palette colours in effect
16	Malformed build configuration	Duplicate keys; one shadow definition never registered
17	Debug logging left in production	Fires on card interaction
18	Reduced-motion honoured by one rule only	Accessibility preference largely ignored

HOW TO READ THIS

A defect list of this length is normal for an application of this maturity that has never had a design system. The material point is that **all eighteen were identified, located and scheduled** — eleven are closed by the seven commits on the next page, and the rest fell to later stages. The register has since grown to seventy-seven as the remaining screens were rebuilt, and all seventy-seven are closed.

Seven commits, sequenced by risk

The work was sequenced so the **first four commits were invisible in the application**. Tokens, styles, helpers and components all landed without anything consuming them — leaving one high-risk commit rather than seven medium-risk ones. All seven are shipped.

#	COMMIT	VISIBLE	CLOSED	STATE
1	Design tokens and build config	No	Defects 1, 2, 15, 16, 18	Shipped
2	Card stylesheet	No	—	Shipped
3	Pure helper functions	No	— (25 tests)	Shipped
4	Presentational components	No	—	Shipped
5	Card rewrite	Yes	Defects 4, 5, 9, 10	Shipped
6	Weather chip and dome handling	Yes	Defects 6, 7, 8	Shipped
7	Cleanup	No	Defects 14, 17	Shipped

WHAT THE SEQUENCE TURNED UP

Two commits landed *before* the sequence that the plan had not anticipated, and both proved to be prerequisites. Four pre-existing type errors were cleared, so that "no new errors" became a meaningful check — one was a screen's core filtering silently untyped. And a linter was installed: the project carried a lint script but no configuration and no linter, so it had never run. **Its first pass found five genuine defects**, including a button that threw when pressed offline and chart titles that had been silently discarded, showing the wrong sport's labels.

Risk management

Commit 5 is the only change a user would notice. Because commits 1 to 4 are additive and leave no visible trace, **commit 5 can still be reverted on its own** — restoring the previous card while keeping the token and accessibility fixes in place. That property survives the release.

Each commit carried its own verification step. The card was checked against **live production data** across every state, all three sports and both themes — including a naturally occurring tied prediction, and confirmation that a covered venue fires no weather request at all.

Deployment

The Android application is a Trusted Web Activity — a thin shell loading the web app at runtime. Interface changes therefore ship through the standard web deployment and reach **the Play Store app, the Microsoft Store app, the PWA and the browser simultaneously**, typically within minutes.

No Android build, no version increment, no store review, and no user action required.

SCOPE DISCIPLINE

The redesign introduced **no API changes, no data-model changes and no routing changes**. One backend edit was made and signed off separately: the missing indoor flag on eight covered ballparks, which had them reporting the weather outside. The only dependencies added were a linter and its plugins, which the lint script had always assumed were present.

What exists today

ASSET	STATUS	LOCATION
Design system specification	Complete	docs/design_system.md
Games screen specification	Complete	Design system, §8.1
Interactive specimens	Complete	Three rendered documents, all states
Defect register	77 of 77 closed	Design system, §11
Brand refresh	Shipped	Icon, splash, wordmark, favicon — live
All four screens built	Shipped	Games, Stats, How to Use, More — plus the shared chrome, modals and guided tour
Automated checks	Passing	Lint, 152 unit tests and build, via npm run check
Remaining work	Six items	Design system, §12 — none is a defect

Coverage of the specification

AREA	STATE	NOTES
Colour, typography, spacing, geometry, elevation, motion, iconography	Built	Both themes, with contrast rationale
Component library	Built	Twelve components; eleven built as shared code, buttons and inputs still owed
Games screen	Built	All states, all three sports, all fallbacks — live
Accessibility	Built	WCAG 2.1 AA, measured per requirement in both themes
Content and voice	Specified	Rules plus worked examples
Stats screen	Built	One configured table, five datasets; the open design question is settled
How to Use, More, guided tour	Built	Rebuilt on the system; the tour spans three screens
Game detail	Direction	Never built. The expanded card already does most of its job

FOR AN INCOMING TEAM

The specification is written to be handed over. It states not only what the interface should look like but **what the application actually knows** — including two facts the code implies but does not deliver, which had already misled a reader once. That section alone prevents a class of future mistakes.
